

● Escape Club

Luxury member travel on autopilot

A production Next.js platform for a private travel club — cinematic landing, secure membership, TiDB-backed trips, and a dashboard with globe, analytics, discovery, and itinerary studio.

Product role: editorial surface sells the club; the signed-in workspace holds dreams, bookings, spend charts, live feed, WebGL globe, and AI-assisted day plans — deployed live on Vercel with SSL TiDB Cloud.

01 · MAIN MOTIVE

Give luxury travel a single member system of record

Motive: replace brochure sites and scattered concierge threads with one auth-gated product where discovery, booking pipeline, and departures stay in sync.

MISSION

Operationalize the club

Every destination, trip status, and itinerary day lives in one TiDB-backed workspace.

INTENT

Sell silence, deliver clarity

GSAP landing for emotion; dashboard for stats, globe, feed, and drag-and-drop days.

NORTH STAR

Always know what's next

Members see the next departure, pipeline, and action without email archaeology.

02 · WHY BUILT

Market friction versus product response

FRICTION

Fragmented luxury stack

- Itineraries in PDFs and WhatsApp
- No signed-in member product
- Maps as marketing only

RESPONSE

Unified club workspace

- JWT auth + dashboard
- Prisma on TiDB Cloud
- Globe + itinerary studio

03 · BUSINESS VALUE

Commercial outcomes the product is built to protect

RETENTION

Member memory

Trips, tiers, and history persist per account in production SQL.

THROUGHPUT

Shorter dream → book

Discovery panel and POST /api/trips compress the pipeline.

QUALITY

Brand-grade UX

Editorial motion, health checks, and empty states that guide first trip.

SCALE

Cloud-ready ops

Vercel deploy, unified escape-club.sql, repeatable db:setup scripts.

04 · USER BENEFITS

What members feel day to day

1

Discover
Rail

2

Dream
List

3

Book
Trips

4

Plan
Days

5

Depart
Live

Less context switching

Clear next departure

Eight curated edges

05 · CORE INTELLIGENCE

What the stack does — and how it runs

Next.js 15 App Router on the surface; Prisma + TiDB Cloud underneath; JWT sessions at the edge. The globe plots real destination coordinates; itinerary generate rebuilds days; Recharts and dnd-kit keep analytics and planning inside one member shell.

PLAN

Itinerary generate

API route builds multi-day plans around destination context and weather windows.

MAP

WebGL globe

react-globe.gl + Three.js render lat/lng from curated seed destinations.

AUTH

Secure sessions

bcrypt passwords, jose JWT cookies, middleware on /dashboard routes.

DATA

TiDB production

SSL DATABASE_URL, /api/health/db, Vercel env for live escape-club.vercel.app.

06 · FULL PICTURE

Product surface at a glance

WHAT

Escape Club product

Landing, join, overview, globe, itinerary studio, trips, charts, discovery, live booking feed.

WHO

Private club members

Travelers who expect editorial marketing and an operational dashboard behind login.

STACK

Next.js 15 · Prisma

React 19, Tailwind 4, GSAP, Framer Motion, TiDB MySQL, GitHub + Vercel production.

OUTCOME

Live deliverable

escape-club.vercel.app — real auth, real database, full-screen UX — not a static mockup site.
